Stringing Characters Together | Lesson 1

Practice: Character Checker

Instructions

Create a small program that prompts the user for a word or phrase and then allows them to query specific positions within that string.

Your application should:

1. Use `readlineSync.question()` to prompt a user for input
2. Prompt a user for an index number to find the character at that index
3. Use bracket notation to access the character
4. Print out the character

Setup

1. Make sure you install `readline-sync` following the instructions in the **Lesson: Values, Data Types, and Operations - 4**.
2. For this activity, you will create your own repository to store your code:
    1. Create a new repository.
    2. Name it: practice-character-checker-[Your First Name]-[Your Last Initial]
    3. Make sure the repository is public.
    4. Clone the repository to your local machine.
    5. Start working on the code.
    6. When you are finished, commit your changes and push them to your repository.

Submission

Submit the url for your GitHub repo in the field below.
